EDUCATION & COURSEWORK

FOUNDATIONS: YEARS 1 AND 2

You start writing programs in your first semester, in CS 108, and CS 112 takes you into data structures the semester after. The first two years build the craft and the theory underneath it: programming, the machine below the language, and the mathematics that lets you prove an algorithm works rather than hope it does. Core courses run from the first year too, so the questions about what computing is for start early.

DEPTH: YEARS 3 AND 4

In the upper years you choose the direction: systems and networks, artificial intelligence and data, security, software engineering, or the applied area of your choice. The fourth year goes into one substantial project, the one employers and graduate schools ask about.

CALVIN HACKATHON

- Students form teams and create a project from scratch in 24 hours
- Students also compete off campus. A Calvin pair took first place at the Atomic Object games

CYBERSECURITY CERTIFICATE

- Six courses, 18 credit hours, taken with any degree
- Built around the Cyber Defense knowledge units published by the NSA and NCAE-C

SEMINARS

- People working in the field come in to talk about jobs, careers, and where computer science, data science and AI are heading
- They run through all four years, not only the final one

SENIOR PROJECT

- A full-year project for real
- Teams choose a project, then plan, research, build, test and deploy it over the year
- Some teams do a research study instead
- Every project ships a public website, and this year a poster too

The full course list for each degree is on the model program sheets in this folder, one per degree.
