EDUCATION & COURSEWORK

FOUNDATIONS: YEARS 1 AND 2

You will begin to write programs in CS 108 in your first semester, and CS 112 takes you into data structures the semester after. The first two years build the craft and the theory underneath your major: programming, the machine below the language, and the mathematics that lets you prove an algorithm works rather than hoping it does. Core courses run during the first year too, so the questions about what computing is for start early.

DEPTH: YEARS 3 AND 4

In the latter half of your degree, you choose the direction you would like to specialize in: systems and networks, Artificial Intelligence and data, security, software engineering, or another applied area of your choice. Your fourth year goes into a capstone project, one employers and graduate schools ask about.

CALVIN HACKATHON

- You form teams and create a project from scratch in 24 hours
- You can also compete off campus
  - *Fun fact: a Calvin pair took first place at the Atomic Object games*

CYBERSECURITY CERTIFICATE

- Six courses, 18 credit hours, taken with any degree
- Built around the Cyber Defense knowledge units published by the NSA and NCAE-C

SEMINARS

- Professionals from the field speak about careers and where Computer Science, Data Science and AI are heading
- Held in all four years, not only the last

SENIOR PROJECT

- A yearlong team project
- Teams select a project, then plan, research, build, test, and deploy it over the year
- Teams have the option to do a research study instead
- Every project creates a public website and a poster that showcase your work

The full course list for each degree is on the model program sheets in this folder, one per degree.
